A Virtual Reality Cookbook

J.F. Balaguer, E. Gobbetti

2

## A Virtual Reality Cookbook

Introduction
Temporal-spatial realism
Sensory feedback
The VB2 system

A Virtual Reality Cookbook

## Virtual Reality

#### Goa

Convince the participants that they are in another place

A Virtual Reality Cookbook

J.F. Balaguer, E. Gobbetti

## Virtual Reality

#### **Technique**

- Participants' sensory inputs are replaced with synthetic information
- Participants are put in the loop of a real-time simulation

A Virtual Reality Cookbook

J.F. Balaguer, E. Gobbetti

## Virtual Reality

#### Motivation

- Participants' tasks are shifted from cognitive to perceptual activities
- The correlation between manipulation and effect on manipulated information is increased

Participants can concentrate on application tasks

A Virtual Reality Cookbook

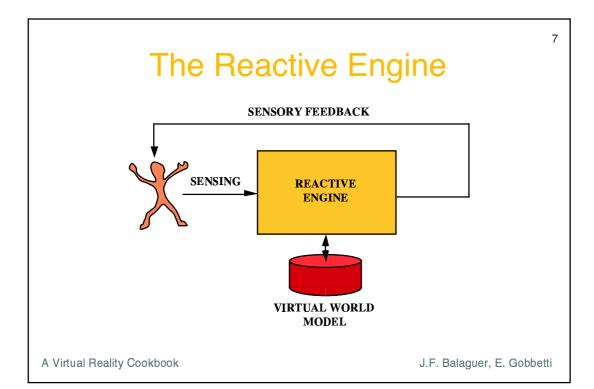

J.F. Balaguer, E. Gobbetti

## Virtual Reality

#### Needs

- Input devices
  - Sense participants motion
- Output devices
  - Replace participants' sensory input
- Reactive applications
  - Immediate response to participants' action
  - Simulation of the virtual world

A Virtual Reality Cookbook

## **Reactive Applications**

Reactive applications are not a new idea:

- Ivan Sutherland, 1965
- Alan Kay, 1969

Modern interactive systems are based on these concepts

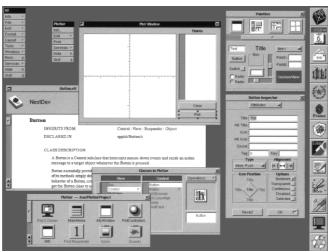

• The DeskTop is a virtual environment!

A Virtual Reality Cookbook

J.F. Balaguer, E. Gobbetti

The DeskTop Virtual Environment

9

A Virtual Reality Cookbook

J.F. Balaguer, E. Gobbetti

# The Desktop Virtual Environment

Input device (mouse)

• 2D motion sensing

Output device (screen)

• 2D image, visual feedback

**Direct manipulation** 

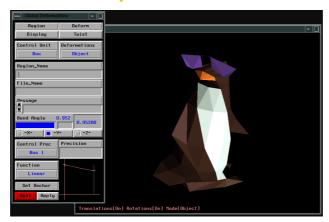

- Continuous two-way man-machine communication
- Physical metaphors, visibility of operations

A Virtual Reality Cookbook

J.F. Balaguer, E. Gobbetti

12

## DeskTop: A 2D world!

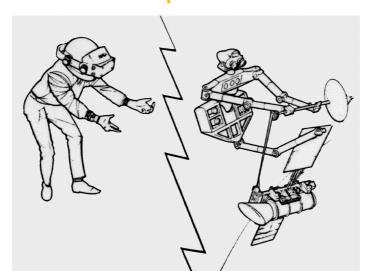

The manipulation of 3D information requires a 3D interface!

A Virtual Reality Cookbook

J.F. Balaguer, E. Gobbetti

**Teleoperation** 

A Virtual Reality Cookbook

## Synthetic Environment

A Virtual Reality Cookbook

J.F. Balaguer, E. Gobbetti

14

## Synthetic Environment

A Virtual Reality Cookbook

#### 3D Virtual Environments

## Same basic reactive model as for 2D applications, but:

- Need for temporal-spatial realism
- · Need for new input devices
  - 3D motion sensing
- Need for new output devices
  - Depth cues to help 3D perception
- Need for new interaction metaphors
  - Manipulation of 3D information

A Virtual Reality Cookbook

J.F. Balaguer, E. Gobbetti

Tracking Electronics

Hand
Tracking Stimulus
Feedback

Head-Mounted Unit

- Head tracking for viewpoint specification
- Hand tracking for manipulation

A Virtual Reality Cookbook

## **Tracking**

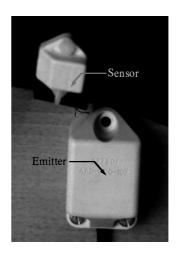

#### Polhemus IsoTrak

- Absolute position and orientation tracking
- Magnetic tracker
- Update rate
  - 60 Hz with one sensor
- Accuracy
  - decreases with sensor-emitter distance
  - at 75 cm from source

0.63 cm in translation

0.85° in orientation

A Virtual Reality Cookbook

J.F. Balaguer, E. Gobbetti

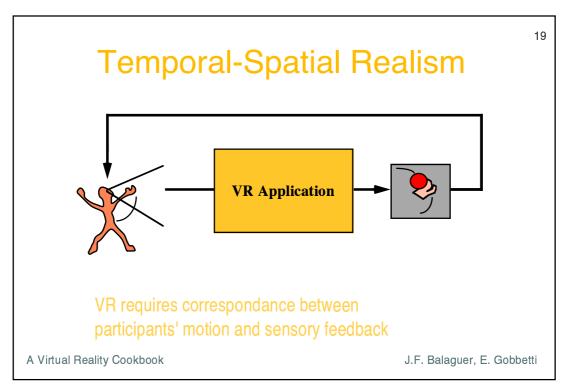

# Hand Measurement

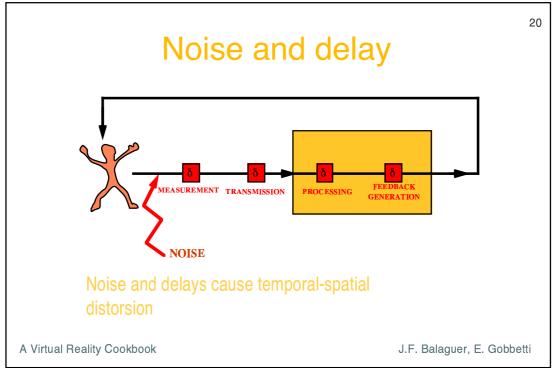

**DataGlove** 

- · Polhemus tracker
- Finger flexion sensors
  - 5° resolution
- Update rate
  - Finger data: 60 Hz
  - Finger and transform data: 30 Hz

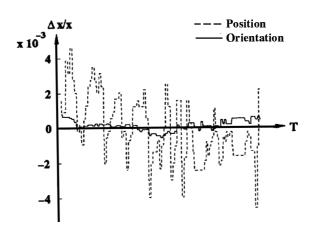

A Virtual Reality Cookbook

22

#### Polhemus Isotrak Noise

A Virtual Reality Cookbook

J.F. Balaguer, E. Gobbetti

## Polhemus Isotrak Delays

• Measurement: 80-150 ms

• Transmission (IPC): 10-50 ms

 Processing and feedback generation delays are dependent on the application

A Virtual Reality Cookbook

## **Temporal-Spatial Distortion**

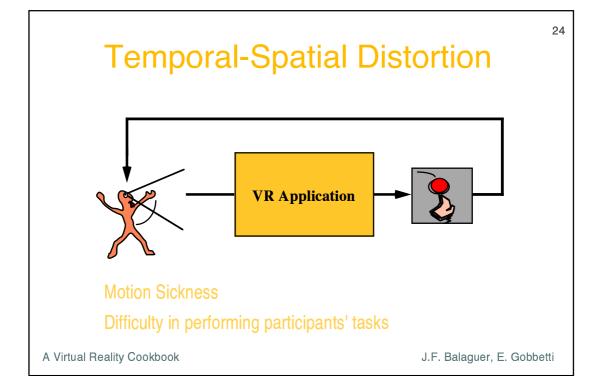

#### Noise in sensor data

Jittering of images

#### Accumulation of delays

Lag between participants' motion and sensory feedback

A Virtual Reality Cookbook

## Temporal-Spatial Realism

#### Noise reduction techniques

- Use better trackers
- Smoothing

#### Delay reduction techniques

- Speed-up applications
  - Faster trackers
  - Faster machines
  - Parallel processing (pipe-line)
- Prediction

A Virtual Reality Cookbook

J.F. Balaguer, E. Gobbetti

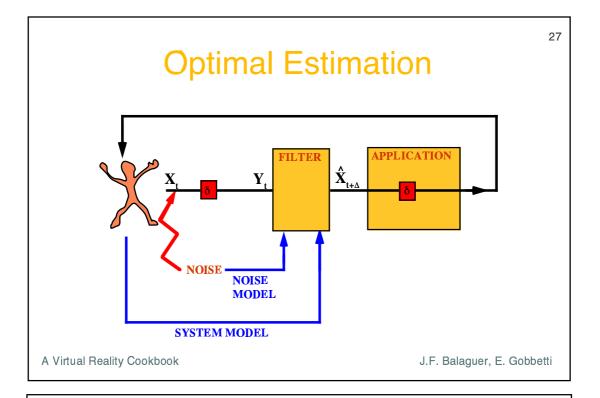

## **Temporal-Spatial Realism**

#### Noise and delay reduction

- Simple low-pass filters increase delays
- Simple predictors increase noise

Noise and distortion have to be handled together

A Virtual Reality Cookbook

#### Kalman Filter

Optimal linear estimates of the state of dynamic models

- Maximum likelihood estimates for Gaussian noises
- Weigthed least square estimate for non-Gaussian noises.

Can be used to predict future values of the state vector

A Virtual Reality Cookbook

J.F. Balaguer, E. Gobbetti

## System model

#### System model

$$X_{t+\Delta t} = f(X_t, \Delta t) + \xi(t)$$

 $m{f}$  models the dynamic evolution of the state vector  $m{X}$ 

 $\xi$  is a white noise process

#### Observation model

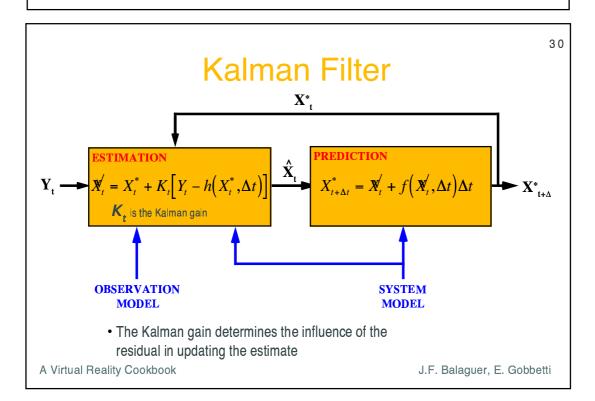

$$Y_t = h(X_t, \Delta t) + \eta(t)$$

**h** models the measurement process

 $\eta$  is a white noise process

Y consists of the sensor readings

A Virtual Reality Cookbook

#### Kalman Filter

#### Filter design steps

- Choose state variables
- Define the random process models
  - System process
  - Observation process
- Find optimal values of the model parameters
  - Measure device noise
  - Minimize filter's error on training data

A Virtual Reality Cookbook

J.F. Balaguer, E. Gobbetti

#### Kalman Filter: Problems

# Humans are not simple dynamic processes

Their behavior is variable and depends on the tasks

Modeling human behavior with a state equation is difficult

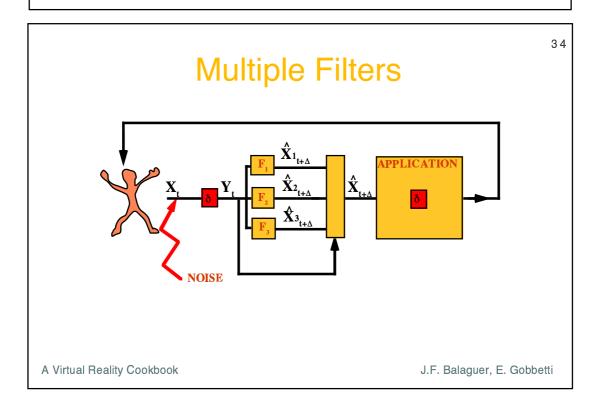

A Virtual Reality Cookbook

## **Modeling Complex Behavior**

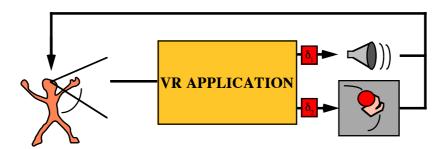

## Participant's behavior is modeled by a state machine

- Each state represent a particular well-defined behavior
  - looking-around, observing, manipulating, etc.
- Each state has its own filter
- The correct filter is chosen based on the prediction error

A Virtual Reality Cookbook

VR requires feedback synchronization

A Virtual Reality Cookbook

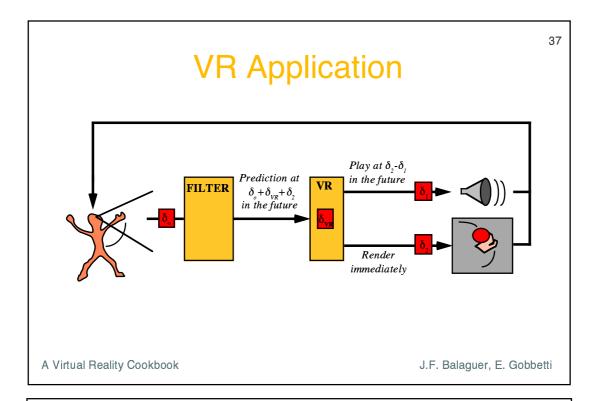

J.F. Balaguer, E. Gobbetti

## Feedback Synchronicity

#### To obtain feedback synchronicity

- Compute longer output generation delay
- Use longest delay for input prediction
- Compensate difference in output delays by using lead times

A Virtual Reality Cookbook

## Sensory Feedback

VR systems must provide information on the virtual world through sensory feedback

- Visual feedback
- Sonic feedback
- Force feedback
- Tactile feedback

A Virtual Reality Cookbook

J.F. Balaguer, E. Gobbetti

#### Visual Feedback

## Feedback must match human vision capabilities

• Should provide cues for depth perception

A Virtual Reality Cookbook

J.F. Balaguer, E. Gobbetti

## **Depth Perception**

#### **Shading and Shadows**

• Help reconstruction of shapes

#### Parallax/Relative Motion

Perceived image changes when the viewer changes position

#### Binocular disparity

 Images perceived by left and right eyes for a given point differ in their horizontal position

A Virtual Reality Cookbook

## **Depth Perception**

#### Perspective

• Far objects appear smaller than close objects

#### Occlusion

• Far objects are hidden by closer objects on the line of sight

A Virtual Reality Cookbook

J.F. Balaguer, E. Gobbetti

## **Depth Perception**

#### Convergence

 Coordinated rotation of eyes when focusing on an object in space

#### Accommodation

 Muscular tension needed to adjust the focal length of the crystalline lens to focus on an object in space

A Virtual Reality Cookbook

## Standard Interactive Displays

#### **Limited Depth Cues**

- Perspective
- Hidden surface removal
- · Basic shading

A Virtual Reality Cookbook

J.F. Balaguer, E. Gobbetti

## Stereo Graphics Displays

#### Binocular disparity

Compute the left and right images from different positions

#### Head tracking

• Allows the simulation of relative motion

#### Fixed accommodation

Decoupled accommodation and convergence

A Virtual Reality Cookbook

## Computing Stereo Pairs: Generalities

45

Horizontal parallax

Vertical parallax

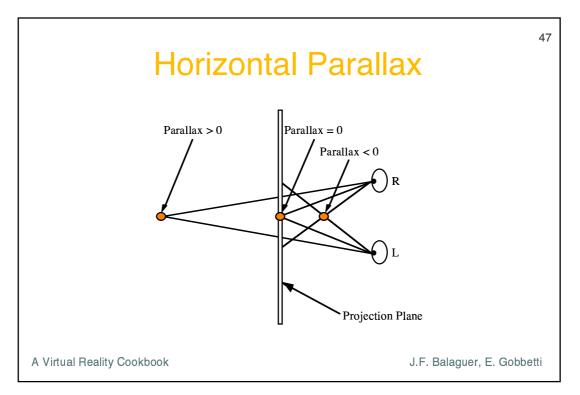

**Rotations and Perspective** 

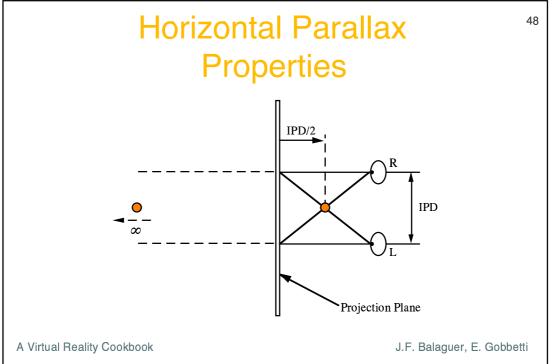

Translations and perspective

A Virtual Reality Cookbook

J.F. Balaguer, E. Gobbetti

# Homologous points of P PR Horizontal Parallax Projection Plane A Virtual Reality Cookbook J.F. Balaguer, E. Gobbetti

#### **Vertical Parallax**

#### Definition

• Difference between the vertical coordinates of homologous points

Causes difficulties for image fusion

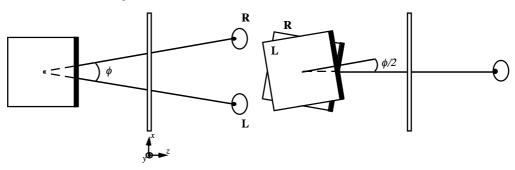

A Virtual Reality Cookbook

J.F. Balaguer, E. Gobbetti

## **Rotations and Perspective**

#### Motivation

Rotate scene around Y axis to simulate eye convergence

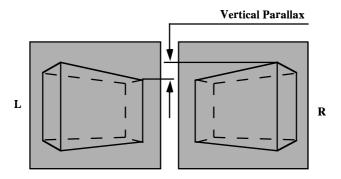

A Virtual Reality Cookbook

## **Rotations and Perspective**

#### **Problem**

• Introduces non constant vertical parallax

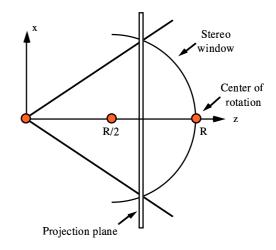

A Virtual Reality Cookbook

J.F. Balaguer, E. Gobbetti

## **Rotations and Perspective**

#### **Problem**

 Non planar stereo window introduces distortion

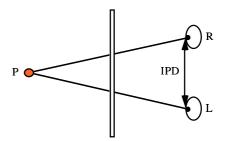

A Virtual Reality Cookbook

## Translations and Perspective

# Use two centers of projection Properties

- No vertical parallax
- Stereo window is planar and coincides with projection plane

A Virtual Reality Cookbook

J.F. Balaguer, E. Gobbetti

54

## Hardware configuration

#### Fixed displays

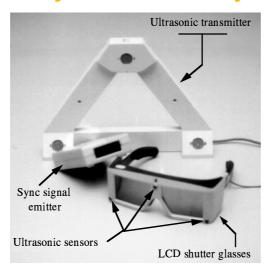

CrystalEyes

#### Head mounted displays

• EyePhones

A Virtual Reality Cookbook

## Cristal Eyes/Cristal Eyes VR

A Virtual Reality Cookbook

J.F. Balaguer, E. Gobbetti

## Fixed Displays - Head Tracking

## The screen is a window on the virtual world

- · Window is fixed in space
- Software must precisely model hardware configuration
- Software must take into account user's IPD

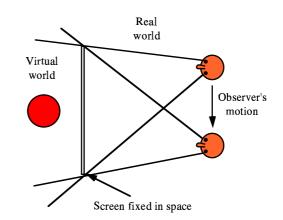

A Virtual Reality Cookbook

## Fixed Displays - Head Tracking

#### **Tracking**

- Software must take into account observer's motion
- Viewing volumes must be recomputed continuously

A Virtual Reality Cookbook

A Virtual Reality Cookbook

J.F. Balaguer, E. Gobbetti

J.F. Balaguer, E. Gobbetti

# Fixed Displays - No Head Tracking Apparent point positions Observed point Parallax changes with head motion Distortion caused by head motion and fixed horizontal parallax

## **Head Mounted Display**

#### EyePhones

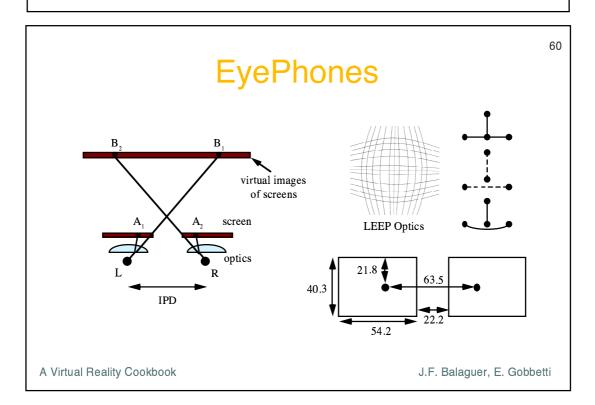

- Non see-through HMD
- Polhemus magnetic tracker
- LCD screens
  - 210x140 color pixels
- LEEP optics
  - Horizontal field of view (FOV)

Single eye: 75°, Overlapped: 60°, Binocular 90°

- Vertical field of view: 58.4°

A Virtual Reality Cookbook

#### VB<sub>2</sub>

A Virtual Reality Cookbook

J.F. Balaguer, E. Gobbetti

## The VB2 System

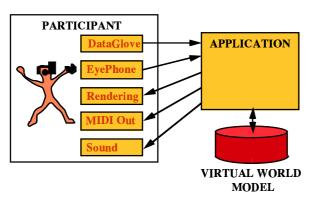

#### Goals

- Provide a basis for constructing VR applications
- Allow experimentation of 3D interaction techniques

A Virtual Reality Cookbook

J.F. Balaguer, E. Gobbetti

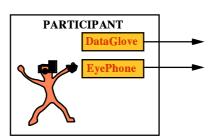

Group of continuously running processes producing and consuming IPC messages

A Virtual Reality Cookbook

J.F. Balaguer, E. Gobbetti

## **Input Processes**

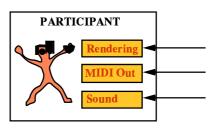

- Encapsulation of input devices
  - DataGlove, SpaceBall, Head Tracker
- Filtering of device data
- Generation of event messages at specified rates

A Virtual Reality Cookbook

J.F. Balaguer, E. Gobbetti

64

#### **Output Processes**

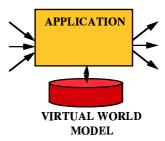

- Encapsulation of output devices
  - Rendering on graphics workstations, MIDI output, playback of prerecorded sound
- Output is triggered by messages from the application process

A Virtual Reality Cookbook

J.F. Balaguer, E. Gobbetti

## **Application Process**

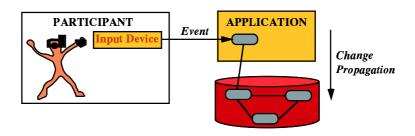

- · Simulation of the evolution of the synthetic world
  - Immediate response to events from input processes
  - Must ensure world's model coherence
- Providing of interaction metaphors
- · Generation of appropriate sensory feedback

A Virtual Reality Cookbook

J.F. Balaguer, E. Gobbetti

#### **Interactive Behavior**

- The virtual world model is updated in response to events coming from input processes
- A change propagation mechanism is responsible of obtaining a coherent evolution

A Virtual Reality Cookbook

J.F. Balaguer, E. Gobbetti

68

## **Change Propagation**

#### Expressiveness

- should allow the specification of general dependencies between objects
  - multi-way relationships
- should permit triggering of output operations

#### **Efficiency**

should ensure the responsiveness of the interface

A Virtual Reality Cookbook

### **Change Propagation**

#### **Constraint Imperative Programming**

- Constraints are used to maintain relationships between objects
  - Declarative
- All computation is performed by constraints
  - Assignment is also a constraint
- The evolution of the model is obtained by adding or removing constraints
  - Imperative

A Virtual Reality Cookbook

J.F. Balaguer, E. Gobbetti

## **Dynamic Model**

#### Components

- Active Variables
  - store the state of the system
- Hierarchical Constraints
  - declaratively represent multi-way relationships between active variables (introduced in ThingLab II, 1987)
- Daemons
  - react to variable changes for imperatively sequencing between system states

A Virtual Reality Cookbook

#### **Active Variable**

#### Primitive element storing the system state

- · Maintains its value
- · Maintains a lists of dependents
- · Keeps track of its state changes
- · Can maintain the history of its past values

Only constraints can modify a variable's value

A Virtual Reality Cookbook

J.F. Balaguer, E. Gobbetti

72

#### **Hierarchical Constraint**

## Specifies a multi-way relation between active variables

- · Declarative part
  - the set of constrained variables
- Imperative part
  - the set of methods that could be used to enforce the constraint
- Priority
  - defines the order in which constraints need to be satisfied in case of conflict

A Virtual Reality Cookbook

## Daemon

# Allows the execution of imperative code when a variable changes value

- · Declarative part
  - the set of variables that trigger the daemon's execution
- Imperative part
  - the code that has to be executed when a variable change

A Virtual Reality Cookbook

J.F. Balaguer, E. Gobbetti

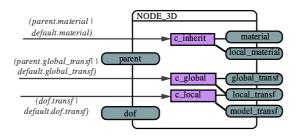

## Variable Path

Symbolic expression of an active variable's location as a function of other variables

- Example
  - Upper\_global\_transf:= (parent.global\_transf or else Identity\_transf)
- Allows the definition of indirect constraints and daemons

A Virtual Reality Cookbook

# **Dynamic Model**

• State: active variables

• Behavior: constraints

A Virtual Reality Cookbook

J.F. Balaguer, E. Gobbetti

76

# State Manager

### **Tasks**

- Keep the constraint network up-to-date
- Trigger daemon execution
- · Maintain indirect paths and variables' history

A Virtual Reality Cookbook

# State Manager

## **Primitive Operations**

- Activation and deactivation of constraints
  - Updating of the constraint graph
- Activation and deactivation of daemons
  - Registering of dependencies

A Virtual Reality Cookbook

J.F. Balaguer, E. Gobbetti

# State Manager

### **Constraint Satisfaction**

- SkyBlue algorithm (Sannella, 1993)
  - Local propagation

heuristic search of the best constraint graph

- Method selection purely based on constraint priorities
- Limited to acyclical constraint graphs
- Separate planning and evaluation phases
- · Lazy evaluation

A Virtual Reality Cookbook

J.F. Balaguer, E. Gobbetti

78

## **Model Evolution**

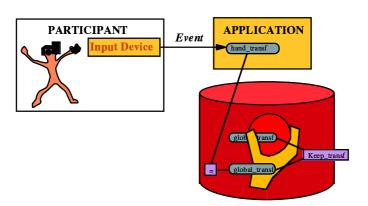

### Interaction

- Mapping between sensor measurements and actions in the virtual world
- · Defined using constraints and daemons

A Virtual Reality Cookbook

J.F. Balaguer, E. Gobbetti

# **Direct Model Manipulation**

• Interaction constraints relate sensors' active variables to variables in the model

A Virtual Reality Cookbook

J.F. Balaguer, E. Gobbetti

30

# **Adaptive Pattern Recognition**

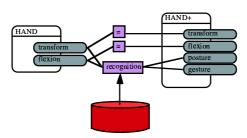

# Enhances data coming from sensors with classification information

- The mapping is learned from examples
- Increases device expressiveness
- The mapping can be adapted to preferences of the user

A Virtual Reality Cookbook

J.F. Balaguer, E. Gobbetti

# **Augmented Device Interface**

· The adaptive pattern recognizer is a constraint

A Virtual Reality Cookbook

# **Recognition Techniques**

### **Recognition steps**

- Preprocessing
  - Filtering, accumulation
- · Extraction of a feature vector
  - Features reduce variability within a class and enhance separation between classes
- Classification
  - Comparison with examples: parametric and non-parametric statistical classification, neural networks

A Virtual Reality Cookbook

J.F. Balaguer, E. Gobbetti

## **Hand Gestures**

## Hand posture and gesture recognition

- Important mean of non-verbal communication
- Allows the simultaneous specification of categorical and quantitative information

A Virtual Reality Cookbook

Finger Flexion

Classification

Posture Type

Similarity
Threshold

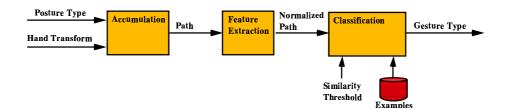

Speed
Threshold

• A posture is a stable hand configuration

A Virtual Reality Cookbook

J.F. Balaguer, E. Gobbetti

## **Hand Gesture Classification**

 A gesture is a path of the hand done while maintaining the fingers in the same posture

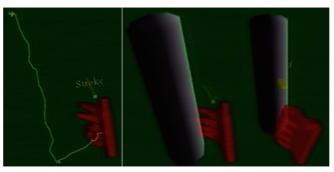

A Virtual Reality Cookbook

J.F. Balaguer, E. Gobbetti

06

85

# Hand Gesture Examples

Creating a cylinder by gestural input

Grabbing the cylinder through posture recognition

A Virtual Reality Cookbook

J.F. Balaguer, E. Gobbetti

88

### Motivation

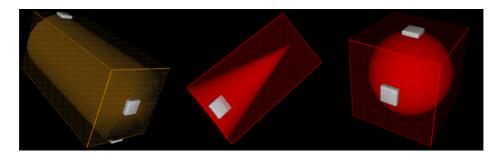

- Gestural input and direct manipulation
  - Partial solutions to the interaction problem
  - Participant must know what can be manipulated and how to manipulate it

**Virtual Tools** 

- · Mediator objects
  - Help understand a model's behavior and interaction metaphors
  - Present a selective view of model's information
  - Offer the interaction metaphor to control it

A Virtual Reality Cookbook

## **Virtual Tools**

First class objects

Encapsulation of visual appearance and behavior

A Virtual Reality Cookbook

J.F. Balaguer, E. Gobbetti

90

# Visual Appearance

### Goals

- Provide information about the tool's behavior
- Offer visual semantic feedback during manipulation

### Representation

· Articulated structure

A Virtual Reality Cookbook

## **Behavior**

### Goals

- Maintain consistency between visual appearance and manipulated information
- Allow information editing through a physical metaphor

### Representation

• Internal constraint network

A Virtual Reality Cookbook

J.F. Balaguer, E. Gobbetti

# Virtual tools

### Multiple tools

- Manipulation of different parts of model's information
- Manipulation of same parts of model's information with different interaction metaphors

A Virtual Reality Cookbook

## **Virtual Tool Protocol**

- Binding
  - Bound active variable

References the manipulated model

- Binding constraints

Multi-way relations

Use indirect path to reference model's variables

- Second order control
  - ensure simultaneous activation/deactivation of binding constraints

Information display

TOOL

bound.v<sub>1</sub>

v<sub>1</sub>

v<sub>2</sub>

bound.v<sub>2</sub>

Information control

A Virtual Reality Cookbook

J.F. Balaguer, E. Gobbetti

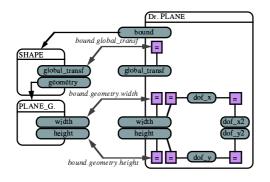

# Manipulation

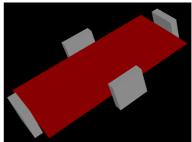

## Physical metaphor Elementary manipulations

- Gestural input
  - initiate and terminate manipulation
     selection/deselection of tool's parts
     activation/deactivation of a motion control constraint
- Information transformation
  - Device sensor values propagate through the tool's constraint network
  - Participant's motion results in model's information changes

A Virtual Reality Cookbook

# Example of Tool: Dr. Plane

A Virtual Reality Cookbook

J.F. Balaguer, E. Gobbetti

96

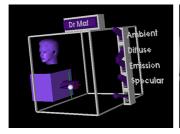

# **Composite Tools**

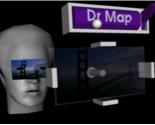

### Tool's composition

- Definition of more complex tools
  - reuse of abstraction
- Enforce interface consistency
  - rapid perception of possible actions

A Virtual Reality Cookbook

# **Examples of Composite Tools**

A Virtual Reality Cookbook

J.F. Balaguer, E. Gobbetti

V<sub>B</sub>2

## Implementation and results

- Object-Oriented, written in Eiffel, composed of more than 500 classes
- Runs on Silicon Graphics workstations
- Complex applications with thousands of variables and constraints can run at interactive speeds

A Virtual Reality Cookbook

## Back To The Future

"The ultimate display would, of course, be a room within which a computer can control the existence of matter. (...) With appropriate programming such a display could literally be the Wonderland into which Alice walked".

• Ivan Sutherland, The Ultimate Display, 1965.

A Virtual Reality Cookbook
